

Amendments to the Abstract

Please replace the Abstract with the following amended Abstract:

An air dryer system including two substantially identical canister-type air dryer units. Each includes, ~~in one mode, a first~~ moist air inlet, a first desiccant ~~for drying air, a first~~ dry air outlet, and first means for supplying dry air to a storage facility. The system also includes~~including, in the same mode,~~ a ~~first~~ bleed valve supplying a small portion of ~~said~~the dry air to regenerate a second desiccant, and a first moist air purge valve ~~for dumping moisture collected during regeneration.~~ The system operates ~~is also operable in the an~~ opposite mode and ~~having a second moist air inlet, a second desiccant, a second dry air outlet and a second means for supplying~~supplies air to a storage facility. ~~A second bleed valve supplies a small portion of dry air to regenerate the first desiccant, and purges air through a second moist air valve.~~ Located between the moist air inlets and the ~~said~~ desiccants are a pair of air-oil separators. In these, upwardly~~Upwardly~~ directed air flows through a housing, striking a deflector plate, and escapes beneath a vertically extending fence and through vents containing a filter medium.
